Understanding Back Propagation

What is Back Propagation?

Back propagation (short for "backward propagation of errors") is a supervised learning algorithm used to train multi-layer neural networks. It involves propagating the error from the output layer back through the network to update the weights iteratively, minimizing the difference between predicted outputs and actual targets.

Key Components of Back Propagation

- **Neural Network Architecture:** Consists of input, hidden, and output layers with interconnected neurons.
- **Weights and Biases:** Parameters that are adjusted during training to improve network performance.
- **Activation Functions:** Functions like sigmoid, tanh, or ReLU that introduce non-linearity.
- **Error Function:** Typically mean squared error (MSE), measuring the difference between predicted and actual values.
- **Learning Rate:** Determines the size of weight updates during training.

The Back Propagation Process

- **Forward Pass:** Inputs are fed through the network to generate an output.

- **Error Calculation:** The difference between the network output and the target is computed.
- **Backward Pass (Error Propagation):** Errors are propagated back through the network to compute gradients.
- **Weights Update:** Using the gradients, weights are adjusted to minimize the error.

Implementing Back Propagation in MATLAB

Setting Up the Data

Before implementing the algorithm, you need to prepare your data. For simplicity, let's consider a small dataset for XOR problem:

```
```matlab

% Input data (XOR problem)

inputs = [0 0; 0 1; 1 0; 1 1]';

targets = [0 1 1 0]; % Corresponding targets

```
```

Designing the Neural Network Structure

A simple neural network for XOR typically includes:

- 2 input neurons
- 1 hidden layer with 2 neurons
- 1 output neuron

Define initial weights and biases randomly:

```
```matlab

% Initialize weights and biases

% Input to hidden layer

W_input_hidden = rand(2,2)/2 - 1; % 2x2 matrix
```

```
b_hidden = rand(2,1)/2 - 1; % 2x1 vector

% Hidden to output layer

W_hidden_output = rand(1,2)/2 - 1; % 1x2 matrix

b_output = rand(1,1)/2 - 1; % scalar

...

```

## Activation Function and Its Derivative

For the XOR problem, sigmoid activation is commonly used:

```
```matlab

% Sigmoid function

sigmoid = @(x) 1./(1 + exp(-x));

% Derivative of sigmoid

sigmoid_derivative = @(x) sigmoid(x).*(1 - sigmoid(x));

...

```

Training Loop with Back Propagation

Implement the training process over multiple epochs:

```
```matlab

% Set training parameters

learning_rate = 0.5;

epochs = 10000;

for i = 1:epochs

 for j = 1:size(inputs,2)

```

```
% Forward pass

input = inputs(:,j);

% Hidden layer

hidden_input = W_input_hidden input + b_hidden;

hidden_output = sigmoid(hidden_input);

% Output layer

final_input = W_hidden_output hidden_output + b_output;

output = sigmoid(final_input);

% Calculate error

target = targets(j);

error = target - output;

% Backward pass

delta_output = error sigmoid_derivative(final_input);

delta_hidden = (W_hidden_output' delta_output) . sigmoid_derivative(hidden_input);

% Update weights and biases

W_hidden_output = W_hidden_output + learning_rate delta_output hidden_output';

b_output = b_output + learning_rate delta_output;

W_input_hidden = W_input_hidden + learning_rate delta_hidden input';

b_hidden = b_hidden + learning_rate delta_hidden;

end

end
```

```
...
```

## Evaluating the Trained Neural Network

After training, test the network to see how well it performs:

```
```matlab

for j = 1:size(inputs,2)

input = inputs(:,j);

% Forward pass

hidden_input = W_input_hidden input + b_hidden;

hidden_output = sigmoid(hidden_input);

final_input = W_hidden_output hidden_output + b_output;

output = sigmoid(final_input);

fprintf('Input: [%d %d], Predicted Output: %.4f\n', input(1), input(2), output);

end

...

```

Expected outputs should be close to the targets (0 or 1), demonstrating successful learning.

Advanced Tips for Back Propagation in MATLAB

Using MATLAB's Neural Network Toolbox

Matlab provides a robust Neural Network Toolbox which simplifies back propagation training with functions like ``train``, ``patternnet``, etc. Example:

net = train(net, inputs, targets);

outputs = net(inputs);

disp(outputs);

...
```

Back Propagation Using MATLAB Code: A Comprehensive Guide

Back propagation remains one of the foundational algorithms for training artificial neural networks

(ANNs). Its efficiency and simplicity have made it the go-to method for adjusting weights in multi-layer networks. This detailed review delves into the mechanics of back propagation, illustrating how to implement it effectively using MATLAB—an environment favored by many researchers and practitioners for its mathematical prowess and ease of visualization.

## Understanding the Fundamentals of Back Propagation

Before diving into MATLAB code, it's crucial to understand the core concepts underpinning back propagation.

### What Is Back Propagation?

Back propagation is a supervised learning algorithm designed to minimize the error in neural networks by iteratively updating weights through gradient descent. It propagates the error backward from the output layer to the input layer, allowing each weight to be adjusted proportionally to its contribution to the output error.

### Key Components of Back Propagation

- Neural Network Architecture: Consists of input, hidden, and output layers with interconnected neurons.
- Activation Function: Non-linear functions like sigmoid, tanh, or ReLU that introduce non-linearity.
- Error Function: Usually Mean Squared Error (MSE) that quantifies the difference between predicted and actual outputs.
- Learning Rate ( $\eta$ ): Determines the size of weight updates.
- Weight Initialization: Starting weights, typically small random values to break symmetry.

### Mathematical Foundations

The core process involves two phases:

- Forward Propagation: Inputs are processed through the network to generate an output.
- Backward Propagation: The error is calculated and propagated backward, updating weights via gradient descent.

The weight update rule for a weight  $w_{ij}$  connecting neuron  $i$  to neuron  $j$ :

$$w_{ij} = w_{ij} - \eta \frac{\partial L}{\partial w_{ij}}$$

$$w_{ij}^{\text{new}} = w_{ij}^{\text{old}} - \alpha \frac{\partial E}{\partial w_{ij}}$$

\]

where  $\delta$  is the error function.

The partial derivative  $\left( \frac{\partial E}{\partial w_{ij}} \right)$  is computed using the chain rule, which involves derivatives of the activation functions.

## Designing a Neural Network in MATLAB

Creating an effective back propagation algorithm in MATLAB involves several steps:

### 1. Network Architecture Specification

Define:

- Number of input neurons
- Number of hidden neurons
- Number of output neurons

Example:

```
```matlab
```

```
input_dim = 2; % Input features
```

```
hidden_dim = 3; % Hidden layer neurons
```

```
output_dim = 1; % Output neuron
```

```
```
```

### 2. Initialization of Weights and Biases

Random initialization helps break symmetry:

```
```matlab
```

```
% Initialize weights with small random values
```

```
W_input_hidden = randn(input_dim, hidden_dim) 0.1;

W_hidden_output = randn(hidden_dim, output_dim) 0.1;

% Initialize biases

b_hidden = zeros(1, hidden_dim);

b_output = zeros(1, output_dim);

...
```

3. Activation Functions

Common choices include sigmoid:

```
```matlab

sigmoid = @(x) 1 ./ (1 + exp(-x));

dsigmoid = @(x) sigmoid(x) . (1 - sigmoid(x));

...
```

## Implementing the Back Propagation Algorithm in MATLAB

Here's a step-by-step outline:

### 1. Forward Pass

Calculate activations for hidden and output layers:

```
```matlab

% Inputs

X = [x1, x2]; % Sample input

% Hidden layer

hidden_input = X W_input_hidden + b_hidden;
```

```
hidden_output = sigmoid(hidden_input);

% Output layer

final_input = hidden_output W_hidden_output + b_output;

output = sigmoid(final_input);

...

```

2. Error Calculation

For supervised learning with target (T) :

```
```matlab

error = T - output;

% For mean squared error

E = 0.5 error^2;

...

```

## 3. Backward Pass (Error Propagation)

Compute deltas (errors) for each layer:

```
```matlab

delta_output = error . dsigmoid(final_input);

delta_hidden = (delta_output W_hidden_output') . dsigmoid(hidden_input);

...

```

4. Updating the Weights and Biases

Adjust weights using the calculated deltas:

```
```matlab

```

```
learning_rate = 0.1;

% Update weights

W_hidden_output = W_hidden_output + (hidden_output' delta_output) learning_rate;

W_input_hidden = W_input_hidden + (X' delta_hidden) learning_rate;

% Update biases

b_output = b_output + delta_output learning_rate;

b_hidden = b_hidden + delta_hidden learning_rate;

...

```

## Full MATLAB Code for a Single Epoch

Here's a complete example assuming a single input sample:

```
```matlab

% Initialize parameters

input_dim = 2;

hidden_dim = 3;

output_dim = 1;

% Random initialization

W_input_hidden = randn(input_dim, hidden_dim) 0.1;

W_hidden_output = randn(hidden_dim, output_dim) 0.1;

b_hidden = zeros(1, hidden_dim);

b_output = zeros(1, output_dim);

% Sample input and target

```

```
X = [0.5, -0.3];

T = 1; % Target output

% Activation functions

sigmoid = @(x) 1 ./ (1 + exp(-x));

dsigmoid = @(x) sigmoid(x) . (1 - sigmoid(x));

% Forward pass

hidden_input = X W_input_hidden + b_hidden;

hidden_output = sigmoid(hidden_input);

final_input = hidden_output W_hidden_output + b_output;

output = sigmoid(final_input);

% Error calculation

error = T - output;

E = 0.5 error^2;

% Backward pass

delta_output = error . dsigmoid(final_input);

delta_hidden = (delta_output W_hidden_output') . dsigmoid(hidden_input);

learning_rate = 0.1;

W_hidden_output = W_hidden_output + (hidden_output' delta_output) learning_rate;

W_input_hidden = W_input_hidden + (X' delta_hidden) learning_rate;

b_output = b_output + delta_output learning_rate;
```

```
b_hidden = b_hidden + delta_hidden learning_rate;
```

```
% Display updated weights
```

```
disp('Updated W_input_hidden:');
```

```
disp(W_input_hidden);
```

```
disp('Updated W_hidden_output:');
```

```

Sample structure:

```
```matlab
```

```
for epoch = 1:max_epochs
```

```
total_error = 0;
```

```
for i = 1:num_samples
```

```
% Extract sample and target
```

```
X = data(i, 1:end-1);
```

```
T = data(i, end);

% Forward pass

% ... (as above)

% Compute error

% ...

% Backward pass

% ...

% Update weights

% ...

total_error = total_error + E;

end

% Optional: display error

fprintf('Epoch %d, Error: %.4f\n', epoch, total_error);

if total_error
break;

end

end

...
```

Challenges include controlling the firing angle accurately to produce the desired output waveform, managing switching losses and harmonics, and ensuring proper commutation of SCRs to prevent device damage and maintain waveform quality. How is the firing angle controlled in a single phase SCR inverter? The firing angle is controlled by adjusting the trigger pulses supplied to the SCRs, typically using a triggering circuit or pulse-width modulation techniques, which determines the point in the AC cycle when the SCRs are turned on. What types of waveforms can be generated using a single phase SCR inverter? Single phase SCR inverters can generate modified sine waves, square waves, or pure sine waves, depending on the control strategy and circuit design used for controlling the SCRs. What are common applications of single phase inverters using SCRs? Common applications include motor drives, uninterruptible power supplies (UPS), heating control systems, and renewable energy systems such as solar inverters where controlled AC power is required from a DC source. How does the commutation process work in SCR-based inverters? Commutation in SCR inverters involves turning off the SCRs after conduction, which can be achieved through natural line commutation, forced commutation circuits, or auxiliary circuits that interrupt the current flow, ensuring proper operation and waveform quality.
